                                                                                             a
                                                                                                                                                                                                                          The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the Polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutates and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                300

The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this
                                                                                        180
                                                                                                                                              540
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis {\sf C}

The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease inhibitor complexes. The protein produced from this sequence contains the alpha-helix0-1 variant.

These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis. Ilver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and
161 ProAlaClyHisAlaValGlyIlePheArgAlaAlaValSerThrArgGlyValAlaLys 180
                 Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C

Nucleic acid construct encoding chimeric Hepatitis C Virus (HCV)

œ

AAX80355;

```
The present invention relates to a nucleic acid construct encoding a chimeric Hepatitis C virus (HCV)-pestivirus genome. The construct comprises a pestivirus genome where a Npro pestivirus protease gene is replaced with a gene encoding a functional HCV NS3 protease. Furthermore, each junction site recognised by the Npro protease is replaced with a junction site recognised by the HCV NS3 protease. The construct is useful for screening compounds that inhibit HCV in vivo by inhibiting HCV protease, where screening may be in cell culture or in an animal model. The present sequence is a chimmeric clone of BVDV (bovine viral diarrhea virus)/HCV NS3-wt, which was used to illustrate the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NS4A-NS3 complex comprising a central hydrophobic domain of native NCV NS4A Peptide, a linker, and an HCV NS4 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminum of the HCV NS4A peptide is tethered by the linker sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination of mode of binding of HCV inhibitors by NNR spectroscopy. They can also be used for detecting inhibitors of the protease activity and the Arpase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the noncovalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SerIleAsnGlyValLeuTrpThrValTyrHisGlyAlaGlyThrArgThrIleAlaSer

                                                                                                                                                                NS4A FNS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide, a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS3A peptide is tethered by the linker to the amino terminus of the HCV NS3A protease domain. The present sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPASE activity of NS3. The covalent Covalent covalent complexes are more soluble, stable and active than the non-

                                                                                                                                                                              NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide, a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, when the helicase activity and the Arpase activity of NS3. The covalent was the helicase activity and the Arpase activity of NS3. The covalent was the model of the model of NS3. The covalent was the model of NS3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        41

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a covalent hepatitis C virus (HCV) NS4A.NS3 complex comprising a central hydrophobic domain of native HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence encodes an example of the above complex. The covalent NS4A NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                         HCV; hepatitis C virus; single chain recombinant complex; linker; NS3 protease; NS4A cofactor; NS4A-NS3 complex; serine protease; hydrophobic domain; covalent complex; detection; inhibitor; ss.

NS4A peptide, a linker, and an HCV NS3 serinc protease domain, where the hydrophobic domain of native HCV NS3 protease domain. The present sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. The year also be used for detecting inhibitors by CAP protease activity, the helicase activity and the ATPASE activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the noncovalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                     102 AlaProGlnGlySerArgSerLeuThrProCysThrCysGlySerSerAspLeuTyrLeu

The present invention describes a covalent hepatitis C virus (HCV) NSAA-NS3 complex comprising a central hydrophobic domain of native HCV NSAA peptide, a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NSAA peptide is tethered by the linker to the amino terminus of the HCV NSAA peptide is tethered by the linker to the amino terminus of the HCV NS3A protease domain. The present sequence encodes an example of the above complex. The covalent NSAA-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPASE activity of NS3. The covalent NSAA-NS3 complexes are more soluble, stable and active than the noncovalent protease-peptide complexes previously available.
HCV; hepatitis C virus; single chain recombinant complex; linker; NS3 protease; NS4A cofactor; NS4A-NS3 complex; serine protease; hydrophobic domain; covalent complex; detection; inhibitor; ss.

Sequence 23, Application US/09965594

Sequence 23, Application US/09965594

Patent No. US20020106642A1

GENERAL INFORMATION:
APPLICANT: Wittekind, Michael
APPLICANT: Welnhelmer, Steven
APPLICANT: Welnhelmer, Steven
APPLICANT: Chang, Yaden
TITLE OF INVENTION: Modified Forms of Hepatitis C NS3 Protease for
TITLE OF INVENTION: Modified Forms of Hepatitis C NS3 Protease for
TITLE OF INVENTION: Modified Forms of Hepatitis C NS3 Protease for
TITLE OF INVENTION: Modified Forms of Hepatitis C NS3 Protease for
TITLE OF INVENTION: Modified Forms of Hepatitis C NS3 Protease for
TITLE OF INVENTION: Modified Forms of Modified Forms of Protease: Inhibitor Complexes
FILE REFERENCE: DB17Sequences
CURRENT FILING DATE: 1999-01-08
FRIOR APPLICATION NUMBER: 60/115,271
PRIOR FILING DATE: 1999-01-08
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 23
LENTH: 594

Patent No. US20020106642a1

GENERAL INFORMATION:
APPLICANT: Wittekind, Michael
APPLICANT: Weinheimer, Steven
APPLICANT: Coldiarb, Valentina
APPLICANT: Coldiarb, Valentina
APPLICANT: Goldfarb, Valentina
TITLE OF INVENTION: Modified Forms of Hepatitis C NS3 Protease for
TITLE OF INVENTION: Pacilitating Inhibitor Screening and Structural Studies
TITLE OF INVENTION: Of Protease:Inhibitor Complexes
FILE REFERENCE: DB17Sequences
CURRENT APPLICATION NUMBER: US/09/965,594

CURRENT FILING DATE: 2001-09-27

PRIOR APPLICANTION NUMBER: 60/115,271

PRIOR PRIOR FILING DATE: 1999-01-08

NUMBER OF SEQ ID NOS: 26

SOFTWARE: Patentin Ver. 2.0
                                                                                                                                                                                                                                                  480

Sequence 15, Application US/09965594
Patent No. US20020106642A1
GENERAL INFORMATION:
APPLICANT: Withekind, Michael
APPLICANT: Weinhelmer, Steven
APPLICANT: Weinhelmer, Steven
APPLICANT: Zhang, Yaqun
APPLICANT: Zhang, Yaqun
TITLE OF INVENTION: Modified Forms of Hepatitis C NS3 Protease for
TITLE OF INVENTION: Pacilitating Inhibitor Screening and Structural Studies
TITLE OF INVENTION: of Protease:Inhibitor Complexes
TITLE OF INVENTION: Of Protease:Inhibitor Complexes
TITLE PEPERENCE: DB17Sequences
CURRENT APPLICATION NUMBER: US/09/965,594
CURRENT APPLICATION NUMBER: 60/115,271
PRIOR FILING DATE: 1999-01-08
                                                                                                                                                                                      ProAlaGlyHisAlaValGlyIlePheArgAlaAlaValSerThrArgGlyValAlaLys 180

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Weinhelmer, Steven
APPLICANT: Weinhelmer, Steven
APPLICANT: Colidato, Valentina
APPLICANT: Colidato, Valentina
TITLE OF INVENTION: Modified Forms of Hepatitis C NS3 Protease for
TITLE OF INVENTION: Acailitating Inhibitor Screening and Structural Studies
TITLE FEFRENCE: DB17Sequences
GILE REFRENCE: DB17Sequences
CURRENT APPLICATION NUMBER: US/09/965,594
CURRENT-FILING DATE: 2001-09-27
                                                                                                                                                                                                                                                                                                                                                                                         160

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1: /SIDSI/gcgdata/geneseq/geneseqp-embl/AA1980.DAT:*

The construct comprises a pestivirus genome where a Npro pestivirus protease gene is replaced with a gene encoding a functional HCV NS3 protease. Furthermore, each junction site recognised by the Npro protease is replaced with a junction site recognised by the HCV NS3 protease. The construct is useful for screening compounds that inhibit HCV in vivo by inhibiting HCV protease, where screening may be in cell culture or in an animal model. The present sequence is a peptide from the tethered NS4A cofactor sequence from HCV NS3, which was used to illustrate the present
                                                              The prosent sequence comprises residues 21-31 of the Hepatitis C virus (HCV) NS4A protease enzyme. It was used to create a number of fusion proteins also containing the HCV NS3 protease. The NS4A and NS3 proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid construct encoding chimeric Hepatitis C Virus (HCV) pestivirus genome where the Npro protease gene is replaced with NS3 protease gene, useful for in vivo screening of compounds which inhibit HCV infection
                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a nucleic acid construct encoding a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes methods and compositions capable of preventing the replication of hepatitis C virus (HCV), involving administering a compound which inhibits NS2/3 autocleavage. Also provided are peptides capable of inhibitting this cleavage step, of which this sequence is an example. These are useful in the treatment of HCV infection in humans and chimpenzees, and in research applications, for example in studying the stabilisation of NS2/3, the effects of NS2/3 on HCV polyprotein processing and the effects of inhibiting NS2/3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cell, or

The present invention relates to a novel pyrrolopyrazinone derivative, its stereoisomer or salt. It was found that the derivative is a Hepatitis C virus (HCV) nonstructural (NS) 3 protease inhibitor. The derivative is useful for the manufacture of a medicament for the treatment of HCV and in therapy for treating HCV infection. The present peptide was used to illustrate the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel ketoamide and ketoester derivatives for use as inhibitors of hepatitis C virus (HVV) NS3 protease inhibitors. The compounds are useful for treating viral infections e.g. hepatitis C virus. The present sequence was used in an experiment measuring the effect of an inhibitor on the rate of hydrolysis of an ester substrate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New ketoamide derivatives useful for treating infections e.g. hepatitis
                                                                                                                                                                                      New pyrrolopyrazinone derivatives useful for treating Hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hepatitis C virus, HCV, NS3 protease, alpha-ketoamide inhibitor,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is the amino acid sequence of the novel sNS4A (synthetic Hepatitis C nonstructural protein 4A) peptide. It acts as a cofactor for the NS3 protease in order to achieve proteclytic processing of Hepatitis C virus (HCV) nonstructural proteins. It is used in the method of the invention as part of a device which can be used to provide information for the design of drugs for the treatment of HCV infection. They can also be used for determining the 3-dimensional structure of molecules or molecular complexes which contain at least some structurally similar features to a HCV NS3 serine protease domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Virucide: pyrrolopyrazinone derivative; Hepatitis C virus inhibitor; nonstructural 3 protease; NS3 protease; viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New hepatitis C virus crystal compositions - comprising a HCV NS3-like polypeptide complexed with a NS4A-like polypeptide, used particularly for drug design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

                                                                                                                                                                                                                                                                                                                                                               The present invention relates to Lactam derivatives. These derivatives may be used for treating hepatitis C virus (HCV) infection. They can also be used for inhibiting HCV in a body fluid sample and as a standard or reagent in a test or assay for determining the ability of a potential pharmaceutical to inhibit HCV NS3 protease and/or HCV growth,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hepatitis C virus; protease; boronic acid; inhibitor; liver cirrhosis;

The present invention provides a number of boronic acid derivatives which act as inhibitors of the hepatitis C virus NS3 protease enzyme. They can be used to treat infection by the virus, which can cause liver cirrhosis and liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New pyrimidinones useful as serine protease inhibitors in the treatment of e.g. viral infection \cdot

                                                                                         a
                                                                                                                                                                                                                 ö
                      The invention relates to pyrimidinones of a formula given in the claims of the specification, their stereoisomers, salts and prodrugs. In assays, the pyrimidinone compounds inhibited Hepatitis C virus (HCV) NS3 protease with IC_5 values of less than 100 micro M. The compounds are useful for treating viral infection e.g. HCV infection (the causative agent of acute hepatitis and associated with cirrhosis and liver cancer) and as a reagent used as inhibitors of HCV protease in the processing of blood plasma for diagnostic and other commercial purposes. The present sequence is a peptide, KNNS4a, used in an NS3 kinetic assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  salts or products which are useful as serine protease inhibitors.
The inidazolidinones of the invention may have virucide, hepatotropic, or antiinflammatory activities and may be used as a serine protease inhibitor (preferably Hepatitis C virus (HCV) NS3 protease inhibitor) or a HCV growth inhibitor. Compounds of the invention are useful for treating viral infection e.g. hepatitis C virus (HCV) infection and as a reagent used as inhibitors of HCV protease in the processing of blood plasma for diagnostic and other commercial purposes. The imidazolidinones of the invention inhibit HCV NS3 protease and/or HCV sequence represents the KNS4a peptide used in the blood plasma assay. The present experiments in the examples of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to novel imidazolidinones or their stereoisomers,
                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New imidazolidinones useful as serine protease inhibitors in the treatment of e.g. viral infection

The soild support is useful for detecting HCV infection in a boloogical sample. The present sequence is NS4A peptide which is used to purify NS3/4a conformational epitope in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention relates to a new immunoassay solid support consisting essentially of at least one hepatitis C virus (HCV) NS3/4a conformational epitope and a multiple epitope fusion antigen (MEFA).

Bound to the support. The NS3/4a conformational epitope and/or sample from an HCV-infected individual. The immunoassay of the invention sample from an HCV-infected individual. The immunoassay of the invention sample. The method of the invention provides a sensitive, accurate diagnostic and prognostic tool to provide adequate patient care and to prevent transmission of HCV by blood and by blood products, or by personal contact. Use of NS3/4a conformational epitope in combination with MEFA, provides a sensitive and reliable method for detecting early HCV seroconversion. Use of MEFA has the aded advantages of decreasing masking problems, improving sensitivity in detecting antibodies by allowing a greater number of epitopes on a unit surface area of substrate, and improving substrate. Detection accuracy is increased and the use of false results is reduced because of the identification and the use of false results is reduced because of the incidence of false results is reduced because of the increased and the use of highly immunogenic HCV antigens which are present during the early stages of HCV seroconversion The present amino acid sequence represents the non-structural protein NS4A peptide sequence. The peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The present invention relates to immunoassays comprising Hepatitis C virus (HCV) NS3/4a conformational epitope and multiple epitope fusion antigen (MERA), bound to a solid support. The NS3/4a epitope fusion to the fusion antigen (MERA), and the fusion antigen (MERA), and the fusion and the fusion and the fusion and fusion are useful for detecting funduoassays and methods of the invention are useful for detecting support provides a sensitive and reliable method for detecting early HCV serconversion. The assays can detect HCV infection caused by any fusion genotypes of HCV. The use of the multiple epitope fusion proteins decreases masking problems, improves sensitivity in detecting antibodies by allowing a greater number of epitopes on a unit area of substrate, and improves selectivity. The present sequence representing HCV type I (HCV-1) NS4a peptide is used in a protease curyme activity assay in the examples of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunoassay solid support for detecting Hepatitis C Virus infection in biological samples, comprises Hepatitis C Virus conformational epitope and multiple epitope fusion antigen -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-MS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor
                                                                                                                                                                                                                                                                                                                                              Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a fusion protein created using the Hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      a
```

```
The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. This sequence contains the alpha-helix0-1
                                                                                                                                                                                                    Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
